PROFILE

Backend developer at a payroll-deduction lending fintech — a regulated sector in Colombia — where I have worked since October 2025.

I built and shipped the credit rules engine, the electronic signature flow with credit-bureau identity validation, and the monthly scoring pipeline that processes around 300,000 records per run. I also led the migration of the platform to a layered architecture.

Currently studying Computer Engineering at UNET. Colombian documents — no visa or sponsorship required. Open to full-time roles in Colombia, remote or hybrid; also international contracting via Deel (GMT-5).

EXPERIENCE

Backend developer *GAF Technology Solutions* · Full-time · Remote, Colombia · Oct 2025 - Present

Payroll-deduction lending fintech, backed by an investment fund.

Credit rules engine CK Comercializadora, a GAF subsidiary

- Modelled the data and translated business policy into a rules schema in PostgreSQL: eligibility, garnishments, term limits, and employment and financial requirements per payer. The business team now adjusts parameters without a deployment.
- Implemented the full evaluation logic: borrowing-capacity calculation under Colombian Law 1527 and Law 50 for active employees and pensioners, decision criteria, special rules, and application re-evaluation.
- Built the public application portal and its front-end and back-end validation, with per-advisor traceability and bot protection.

Laravel · Vue.js · Inertia.js · PostgreSQL

Electronic signature with identity validation

- Implemented the state machine that tracks the identity-validation provider queue, preserving XML integrity across chained requests.
- Delivered the payroll-lending module end to end: multi-step form with section autosave, PDF draft, email history, and S3 upload retries.
- Extracted a generic signing pattern so later modules could implement it instead of duplicating the flow.

Laravel · Vue.js · TransUnion · AWS S3

Monthly credit scoring process

- Took a risk model living in a data analyst notebook to production: a containerised monthly cron job that reads from PostgreSQL, runs the model and persists results. Scoring was not automated before this.
- Processes around 300,000 records per run, loading in batches of five thousand, with on-disk state tracking to avoid reprocessing the same artifact and invalid-row handling that does not abort the load.
- Added a live API lookup so a customer score can be shown on the underwriting screen.

Python · PostgreSQL · Docker · Laravel

Access control and auditing

- Consolidated access control on Spatie — guards, middleware and policies — with a migration that moved existing users and roles to the new schema without interrupting operations.
- Worked on authentication hardening and on traceability of business-critical events ahead of a security audit.

Spatie Permission · Authentication · Auditing · Laravel

Migration to a layered architecture

- Led and verified the migration of a six-year-old platform — over two hundred Eloquent models mixed with controllers, queues and providers — to a layered architecture.
- With no test suite to rely on, the migration went module by module with verification at each step. Three months, reviewed by the tech lead.

Hexagonal Architecture · DDD · Laravel

Freelance, part-time *Self-employed* · Part-time · Jan 2026 – Present

AI process automation

- Automation pipelines built with n8n and the OpenAI API for content generation.
- Conversational Telegram bot integrated with n8n and PostgreSQL handling requests end to end.

n8n · OpenAI API · PostgreSQL

Personal projects · Jul 2026 – ongoing

Video clipping CLI

- TypeScript command-line tool that splits long video into vertical clips: Whisper transcription, script generation by a model whose output is schema-validated, speech synthesis, and subtitle rendering with Remotion.
- Every step persists its result to disk and the process is resumable, so already-paid model calls are never repeated.

TypeScript · Node.js · Remotion · ffmpeg

EDUCATION

Computer Engineering, Universidad Nacional Experimental del Táchira (UNET). Currently in 7th semester.

SKILLS

Backend PHP / Laravel · PostgreSQL / SQL · MySQL · Hexagonal Architecture / DDD · Testing (PHPUnit / pytest) · Python · Node.js

Security Roles and permissions (Spatie) · MFA / session management · SAST and secret detection · reCAPTCHA Enterprise

Automation & AI n8n · OpenAI API · API / webhook integration

Frontend Vue.js · Inertia.js · Blade · Tailwind CSS · React · TypeScript

Infrastructure Docker · Linux / Nginx · CI/CD (GitHub Actions) · Google Cloud Platform · AWS S3

LANGUAGES

Spanish (native) · English B2, C2 reading

CERTIFICATIONS

- Generative AI Fundamentals & Prompt Engineering for Developers — Coursera
- Intensive Python Programming Certification — Coursera
- Google IT Automation with Python Professional Certificate — Coursera (in progress)
- EF SET English Certificate — B2 overall, C2 reading
