PROFESSIONAL SUMMARY

Backend developer working with PHP/Laravel and Python on PostgreSQL. I work on configurable business logic, REST APIs, integrations with external services, batch processing, query optimisation, access control, and deployment with Docker on Linux. All my production experience comes from a credit fintech.

Laravel · PHP · PostgreSQL · REST APIs · Python · Docker

PROFESSIONAL EXPERIENCE

Backend developer

GAF Technology Solutions

Oct 2025 - Jul 2026

Fixed-term project contract · Remote, Colombia

Payroll-deduction lending fintech. Technology team of 4: 2 developers, a tech lead, and an infrastructure and security lead. Applications are originated by CK Comercializadora, a company in the same group.

Credit rules engine Laravel, Vue.js, Inertia.js, PostgreSQL

- Modelled the data and translated business policy into a rules schema in PostgreSQL: eligibility, garnishments, term limits, and employment and financial requirements per payer. The business team now adjusts parameters without a deployment.
- Implemented the full evaluation logic: borrowing-capacity calculation under Law 1527 (payroll-deduction lending) and Law 50 for active employees and pensioners, decision criteria, special rules, and application re-evaluation.
- Built the public application portal and its front-end and back-end validation, with per-advisor traceability and reCAPTCHA Enterprise. A colleague built the submission API; I restructured its request body as the model changed.

Electronic signature with identity validation Laravel, Vue.js, Python, TransUnion, AWS S3

- Built the electronic signature module from scratch, replacing a disused legacy one: the document is 24 pages that used to be filled in by hand and are now generated automatically from templates, with a different template per product.
- Designed the flow as a state machine over the asynchronous responses from the provider: an advisor approves a draft, customer data is validated against TransUnion, and identity is verified by OTP or KBA.
- Closed the whole procedure in about 20 minutes, with the signed document returned with its hash, full transaction traceability and a copy kept in S3.

Monthly credit scoring process Python, PostgreSQL, Docker, Laravel

- Took a risk model living in a script owned by the risk team to production: a containerised monthly cron job that reads from PostgreSQL, runs the model and persists results. Scoring was not automated before this.
- Processed over 320,000 distinct people per run, loading in batches of 5,000, with an idempotent and resumable process and invalid-row handling that does not abort the load.

Query optimisation in production PostgreSQL, SQL, Laravel, Eloquent ORM

- Cut a multi-table query from 20-30 seconds down to 3-6, removing the timeouts that made the screen depending on it unusable under high volume.
- Applied filters upfront so the join would not start from the full set, added indexes on the fields used in joins and filters, and paginated the response so the page stopped loading everything at once.

Access control and permissions Spatie Permission, Laravel, PostgreSQL

- Built the platform permission tree across 17 modules, with permissions down to the option and sub-process level, locked down every route, and migrated existing users and roles to the new schema without interrupting operations.

Migration to a layered architecture Layered architecture, Laravel, PostgreSQL

- Took part in the first stage of migrating the platform — six years of code — to a layered architecture, removing raw SQL queries from controllers entirely.
- Verified every change module by module before moving on, reviewed by the tech lead at each step. Three months of work.

Infrastructure and deployment Docker, Linux, Nginx, GCP, Certbot

- Containerised the application with Docker, which had been running natively on the machine, and deployed it on a new GCP instance with nginx as a reverse proxy between the containers and the host.
- Ran the migration in parallel: brought up and validated the new instance while the old one was still in production, configured the domain DNS and issued the certificates with Certbot until the application ran entirely over HTTPS. No service interruption.

PROJECTS

Glass shop quoter Freelance project · Aug 2026 – ongoing Python, FastAPI, Vue.js, Tailwind CSS, Vercel

Gestienda Personal project · Nov 2026 – ongoing React, JavaScript, PostgreSQL, Supabase, PWA

Portfolio Personal project · 2026 React, TypeScript, Python, FastAPI, Vercel

- Built this site with React and TypeScript, with the bilingual content coming out of a single profile file that also feeds this CV, and the animations written without a library.
- Behind it runs a conversational agent in Python on serverless functions, answering about my background and knowing only what is in its knowledge base, versioned text files.
- Rebuilt the orchestration in Python on deployment, because the Vercel free plan does not support n8n; dropped litellm after measuring it (133 MB of 199, against a 250 MB per-function ceiling) and talk to the model over plain REST with httpx.

TECHNICAL SKILLS

Backend PHP, Laravel, Eloquent ORM, REST APIs, Python, Node.js, Layered architecture (domain, application, persistence), Testing (PHPUnit)

Databases PostgreSQL, SQL, MySQL, Data modelling and migrations, Query and index optimisation

Security and access control Roles and permissions (Spatie), MFA and session management, SAST and secret detection (Snyk, gitleaks), reCAPTCHA Enterprise

Automation & AI DeepSeek API, OpenAI API, n8n, API and webhook integration

Frontend Vue.js, Inertia.js, Blade

Infrastructure Docker, Linux, Nginx, GCP, AWS S3, Certbot

Process Git, GitHub Actions, CI/CD, Agile methodologies

EDUCATION

Computer Engineering, Universidad Nacional Experimental del Táchira (UNET).

LANGUAGES AND CERTIFICATIONS

Spanish (native) · English B2 (EF SET) · Google IT Automation with Python — Coursera (in progress)
